

Maximizing Chronic Obstructive Pulmonary Disease (COPD) Outcomes

Alanna Breckenridge, PharmD, BCGP
 Northside Hospital Forsyth Transition of Care Clinical Pharmacist
 Atlanta Academy of Institutional Pharmacy
 July 20th, 2023

Disclosures

- There are no financial conflicts of interest to disclose.

Maximizing COPD Outcomes Objectives

At the conclusion of this program, pharmacist participants should be able to:

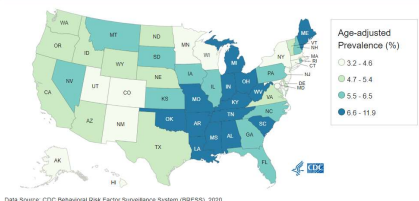

- Review the basics of COPD including incidence, definition, diagnosis, and staging
- Discuss smoking cessation consulting for patients with COPD
- Review vaccination schedule recommended for patients with COPD
- Describe treatment recommendations for patients with COPD
- Evaluate device selection and proper inhaler technique when counseling patients with COPD

At the conclusion of this program, pharmacy technician participants should be able to:

- Define COPD
- List one reason why smoking cessation may be beneficial for a patient with COPD
- Recall two vaccines recommended for patient with COPD
- Recognize common treatments for patients with COPD

COPD: Incidence

Worldwide	US
250 million living with COPD	16 million living with COPD
> 3 million annual deaths	> 150 thousand annual deaths
3 rd leading cause of death	4 th leading cause of death

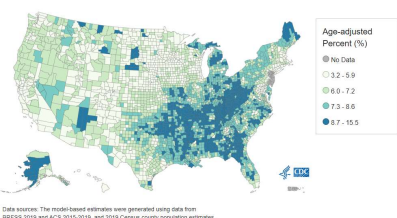

Data Source: CDC Behavioral Risk Factor Surveillance System (BRFSS), 2012.
COPD based on affirmative response to the question: "Has a doctor, nurse, or other health professional ever told you that you have COPD, emphysema, or chronic bronchitis?"
Prevalence age-standardized to the 2001 US projected population.

<https://www.cdc.gov/copd/data-and-statistics/state-estimates.html>

https://foundation.chestnet.org/wp-content/uploads/2021/04/GSK_COPD_patient-information.pdf

COPD: Incidence by County

Data source: The model-based estimates were generated using data from 2008-2018 and ACS 2010-2018 and 2014 Census county population estimates.

<https://www.cdc.gov/copd/data-and-statistics/county-estimates.html>

COPD is the _____ leading cause of death worldwide.

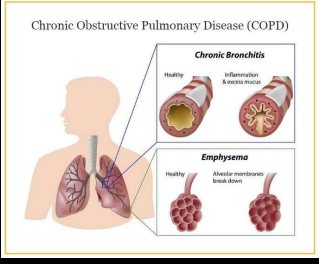

- 1. First
- 2. Second
- 3. Third
- 4. Fourth

COPD Basics: Definition

Definition: A preventable and treatable heterogeneous lung condition characterized by chronic respiratory symptoms

- **dyspnea**
- **cough**
- **sputum production**
- **and/or exacerbations**

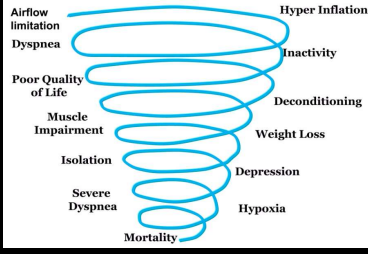

due to abnormalities of the airways (bronchitis, bronchiolitis) and/or alveoli (emphysema) that cause persistent, often progressive, airflow obstruction

Chronic Obstructive Pulmonary Disease (COPD)

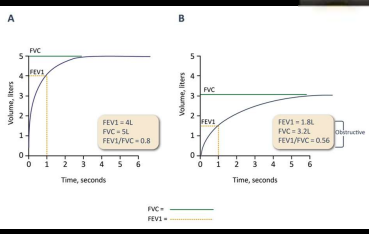

© 2022, 2023 Global Initiative for Chronic Obstructive Lung Disease <https://www.halodx.com/lung/copd/>

The Dyspnea Spiral

COPD: RISK FACTORS AND DIAGNOSIS

- **Causes and Risk Factors**
 - Gene-Environmental exposures over the lifetime that damage lungs
 - Main exposure is **tobacco** smoking, followed by never-smokers and workplace exposures in US and toxic particles and gases from household and outdoor air pollution worldwide
 - Rare gene mutation in **SERPINA1** gene leading to α -1 antitrypsin deficiency
 - Other: asthma, severe childhood respiratory infections, low socioeconomic status
- **Diagnosis**
 - Extremely under-diagnosed
 - Non-fully reversible airflow obstruction confirmed with spirometry:
 - $FEV_1/FVC < 0.7$
 - **post-bronchodilation**

© 2022, 2023 Global Initiative for Chronic Obstructive Lung Disease

Proposed Taxonomy (Etiotypes) for COPD

Classification	Description
Genetically determined COPD (COPD-G)	Alpha-1 antitrypsin deficiency (AATD) Other genetic variants with smaller effects acting in combination
COPD due to abnormal lung development (COPD-D)	Early life events, including premature birth and low birthweight, among others
Environmental COPD	
Cigarette smoking COPD (COPD-C)	<ul style="list-style-type: none"> - Exposure to tobacco smoke, including in utero or via passive smoking - Vaping or e-cigarette use - Cannabis
Biomass and pollution exposure COPD (COPD-F)	Exposure to household pollution, ambient air pollution, wildfire smoke, occupational hazards
COPD due to infections (COPD-I)	Childhood infections, tuberculosis associated COPD, HIV-associated COPD
COPD & asthma (COPD-A)	Particularly childhood asthma
COPD of unknown cause (COPD-U)

Becoming a Non-smoker

Ready to Quit

Is It Worth It?
Nearly 1 in 5 deaths each year is caused by smoking.
READYTOQUITGA.COM

YOU can quit smoking, vaping, and using smokeless tobacco today! When you are ready, we can help. Improve your chances of quitting by calling or texting the Georgia Tobacco Quit Line (GTQL).

Built To Quit - Smoking and Tobacco Cessation Course

Our Built To Quit course offers the American Lung Association Freedom From Smoking® program and access to the following resources:

- Certified Facilitators** - Classes are led by American Lung Association Freedom From Smoking program certified facilitators.
- Group Classes** - In-person class meets once a week for six weeks on the Northside Hospital campus.
- Remote Classes** - Six-week online class facilitated by Northside staff are also available.
- Telephone Counseling** - Referrals to the Georgia Tobacco Quit Line (877-270-STOP).
- Pharmaceutical Assistance** - Free or reduced-cost nicotine replacement therapy (patch or patches) for those that qualify.
- Online Support** - Referrals to American Lung Association's Freedom From Smoking® online community.
- Mobile App for Android and iPhone devices** - **QUITSTART**, a product of Smokefree.gov.

Call the Lung Helpline
Ask a Question

Lung Health & Diseases | **Quit Smoking** | Clean Air

Brief Strategies to Help the Patient Willing to Quit Table 3.1

ASK	Systematically identify all tobacco users at every visit Implement an office-wide system that ensures that, for EVERY patient at EVERY clinic visit, tobacco-use status is queried and documented
ADVISE	Strongly urge all tobacco users to quit In a clear, strong, and personalized manner, urge every tobacco user to quit
ASSESS	Determine willingness and rationale of patient's desire to make a quit attempt Ask every tobacco user if he or she is willing to make a quit attempt at this time (e.g., within the next 30 days)
ASSIST	Aid the patient in quitting Help the patient with a quit plan; provide practical counseling; provide intra-treatment social support; help the patient obtain extra-treatment social support; recommend use of approved pharmacotherapy except in special circumstances; provide supplementary materials
ARRANGE	Schedule follow-up contact Schedule follow-up contact, either in person or via telephone

© 2022, 2023 Global Initiative for Chronic Obstructive Lung Disease

Tobacco Dependence and Treatment

- Smoking Topography:**
 - Nicotine yield of cigarette x
 - Number of puffs x
 - Frequency of puffs x
 - Volume of puffs x
 - Puff Depth x
 - Duration of Hold
- Predicts level of dependence, ability to quit, risk of relapse, risk for disease
- Pack per day is LESS useful in individualizing treatment plans

From the work of Dr. Panagis Galatiatos Johns Hopkins
Jarvis MJ et al. J Natl Cancer Inst 2001;93:134
Kim S. Int J Environ Res Public Health 2018;15:pii:E1024

What is the best predictor of smoking dependence?

- 1. Age when started smoking
- 2. Number of ears smoking
- 3. Pack year history
- 4. Smoking topography

Nicotine Delivery Rates

Pharmacokinetics of the cigarette

AUC

Plasma in nicotine (mg/ml)

From the work of Dr. Panagis Galatsatos

Tobacco Dependence and Treatment

Controller: Controls intensity and frequency of negative prediction error signal
Rescue: Respond to the signal

Vaccinations

Vaccine	Recommended by
Influenza	CDC
SARS-CoV-2	WHO and CDC
20-valent pneumococcal conjugate (PCV20) x1 OR 15-valent pneumococcal conjugate (PCV15) x1 followed by 23-valent pneumococcal polysaccharide (PPSV23)	CDC
Tdap (dTaP/dTIPa) who were not vaccinated in adolescence	CDC
Zoster for patients >50 years old	CDC

© 2022, 2023 Global Initiative for Chronic Obstructive Lung Disease

Which 2 vaccines are recommended by the CDC for patients with COPD?

- 1. Influenza
- 2. Pneumococcal PCV 20
- 3. Hepatitis A
- 4. A and B

Pharmacological Therapy for Stable COPD

Goals of therapy:

- Reduce symptoms
- Reduce frequency and severity of exacerbations
- Improve exercise tolerance and health status

© 2022, 2023 Global Initiative for Chronic Obstructive Lung Disease

Initial Pharmacological Treatment Figure 4.2

≥ 2 moderate exacerbations or ≥ 1 leading to hospitalization	GROUP E LABA + LAMA* <i>consider LABA+LAMA+ICS* if blood eos ≥ 300</i>	
0 or 1 moderate exacerbations (not leading to hospital admission)	GROUP A A bronchodilator mMRC 0-1, CAT < 10	GROUP B LABA + LAMA* mMRC ≥ 2, CAT ≥ 10

*single inhaler therapy may be more convenient and effective than multiple inhalers

LABA= Long Acting Beta-2 Agonist, LAMA= Long Acting Muscarinic Antagonist, ICS= Inhaled Corticosteroids, eos= eosinophils, mMRC= modified Medical Research Council, CAT= COPD Assessment Test

© 2022, 2023 Global Initiative for Chronic Obstructive Lung Disease

Pharmacologic Therapy

Medication Class	Mechanism	Adverse Effects	Examples
Beta-2 agonist	Relax airway smooth muscle	Resting sinus tachycardia, cardiac rhythm disturbances, somatic tremor, hypokalemia	SABA: albuterol, levalbuterol LABA: formoterol, salmeterol, olodaterol, vilanterol, arformoterol
Muscarinic antagonist	Block broncho-constrictor effects in airway smooth muscle	Dry mouth, urinary retention	SAMA: ipratropium LAMA: tiotropium, aclidinium, glycopyrrolate, umeclidinium, revefenacin
Inhaled corticosteroid	anti-inflammatory effects	Oral candidiasis, hoarse voice, skin bruising and pneumonia	ICS: budesonide, fluticasone

LABA= Long Acting Beta-2 Agonist, SABA= Short Acting Beta-2 Agonist, LAMA= Long Acting Muscarinic Antagonist, SAMA= Short Acting Muscarinic Antagonist, ICS= Inhaled Corticosteroid

Bronchodilators in Stable COPD

Table 3.4

- Inhaled bronchodilators in COPD are central to symptom management and commonly given on a regular basis to prevent or reduce symptoms (Evidence A)
- Regular and as-needed use of SABA or SAMA improves FEV1 and symptoms (Evidence A)
- Combinations of SABA and SAMA are superior compared to either medication alone in improving FEV1 and symptoms (Evidence A)
- LABAs and LAMAs significantly improve lung function, dyspnea, health status, and reduce exacerbation rates (Evidence A)
- LAMAs have a greater effect on exacerbation reduction compared with LABAs (Evidence B) and decrease hospitalizations (Evidence B)
- Combination treatment with a LABA and a LAMA increases FEV1 and reduces symptoms compared to monotherapy (Evidence A)
- Combination treatment with a LABA+LAMA reduces exacerbations compared to monotherapy (Evidence B)
- Tiotropium improves the effectiveness of pulmonary rehabilitation in increasing exercise performance (Evidence B)
- Theophylline exerts a small bronchodilator effect in stable COPD (Evidence A) and that is associated with modest symptomatic benefits (Evidence B)
- Single inhaler therapy may be more convenient and effective than multiple inhalers

© 2022, 2023 Global Initiative for Chronic Obstructive Lung Disease

Factors to Consider when Initiating ICS Treatment

Figure 3.1

Factors to consider when adding ICS to long-acting bronchodilators:
(note the scenario is different when considering ICS withdrawal)

STRONGLY FAVORS USE

- History of hospitalization(s) for exacerbations of COPD*
- ≥ 2 moderate exacerbations of COPD per year*
- Blood eosinophils ≥ 300 cells/μL
- History of, or concomitant asthma

FAVORS USE

- 1 moderate exacerbation of COPD per year*
- Blood eosinophils 100 to < 300 cells/μL

AGAINST USE

- Repeated pneumonia events
- Blood eosinophils < 100 cells/μL
- History of mycobacterial infection

*Despite appropriate long-acting bronchodilator maintenance therapy (see Table 3.4 and Figure 4.3 for recommendations). Note that blood eosinophils should be seen as a continuum; quoted values represent approximate cut points; eosinophil counts are likely to fluctuate. Adapted from & reproduced with permission of the © 193, 2019: European Respiratory Journal 57 (Pt 2):201278, DOI: 10.1183/13993003.001279-2019 Published 21 December 2019

© 2022, 2023 Global Initiative for Chronic Obstructive Lung Disease

Combination Maintenance Pharmacologic Therapy

LABA + LAMA	LABA + ICS	LABA + LAMA + ICS
Umeclidinium/vilanterol (Anoro) Glycopyrrolate/formoterol (Bevespi) Tiotropium/olodaterol (Stiolto)	Fluticasone/salmeterol (Advair) Fluticasone/vilanterol (Breo) Budesonide/formoterol (Symbicort)	Fluticasone/umeclidinium/vilanterol (Trelegy) Budesonide/glycopyrrolate/formoterol (Breztri)
Increase FEV1 and reduces dyspnea and exacerbations compared to monotherapy	Combination is more effective than individual component in improving lung function and health status and reducing exacerbation in patients with exacerbations and moderate to very severe COPD. Not encouraged due to lack of impact on mortality, benefit with addition of LAMA (triple therapy)	Reduced mortality compared to LABA + LAMA in symptomatic people with history of frequent and/or severe exacerbations. Improves lung function, symptoms and health status, and reduces exacerbations compared to LABA + ICS, LABA + LAMA or LAMA monotherapy.

LABA= Long Acting Beta-2 Agonist, LAMA= Long Acting Muscarinic Antagonist, ICS= Inhaled Corticosteroid

Management of Severe but not Life-threatening Exacerbations*

Table 5.4

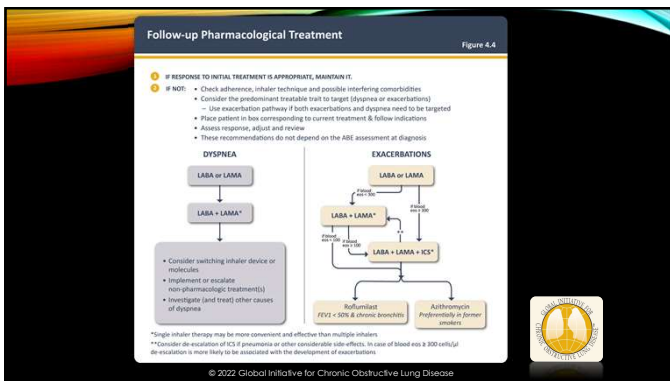

Exacerbation: an event characterized by increased **dyspnea** and/or **cough** and **sputum** that worsens in < 14 days. Usually associated with airway inflammation and gas trapping.

- Assess severity of symptoms, blood gases, chest radiograph
- Administer supplemental oxygen therapy, obtain serial arterial blood gas, venous blood gas and pulse oximetry measurements
- Bronchodilators:
 - Increase doses and/or frequency of short acting bronchodilators
 - Combine short-acting beta-agonists and anticholinergics
 - Consider use of long-acting bronchodilators when patient becomes stable
 - Use spacers or air-driven nebulizers when appropriate
- Consider oral corticosteroids
- Consider antibiotics (oral) when signs of bacterial infection are present
- Consider noninvasive mechanical ventilation (NIV)
- At all times:
 - Monitor fluid balance
 - Consider subcutaneous heparin or low molecular weight heparin for thromboembolism prophylaxis
 - Identify and treat associated conditions (e.g., heart failure, arrhythmias, pulmonary embolism etc.)

*Local resources need to be considered

© 2022, 2023 Global Initiative for Chronic Obstructive Lung Disease

Add-on Pharmacologic Therapy

Medication class	Use	Adverse Effects	Example
Phosphodiesterase-4 Inhibitor	Indicated in patients with FEV1 <50% (severe-very severe COPD), with chronic bronchitis and a history of exacerbations in patients treated with controller respiratory medication	Diarhea, nausea, reduced appetite, weight loss *use with caution in patients with depression	roflumilast
Macrolide antibiotic	May reduce exacerbation rates in first year in patients prone to exacerbations	Increase rates of antimicrobial resistance, increase rates of hearing impairment, QT-prolongation	azithromycin 250mg daily or 500mg three times weekly erythromycin 250mg BID

What treatment does every patient with COPD need?

- 1. SABA +/- SAMA
- 2. LABA + LAMA
- 3. LABA + ICS
- 4. LABA + LAMA + ICS

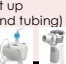

If a patient has worsening symptoms or exacerbations, what treatment do they need?

- 1. SABA +/- SAMA
- 2. LABA + LAMA
- 3. LABA + ICS
- 4. LABA + LAMA +/- ICS

How often do you educate on proper inhaler use?

- 1. More than once a week
- 2. Occasionally
- 3. Rarely
- 4. Never

Types of Respiratory Delivery Devices

	Metered Dose Inhalers (MDIs)	Soft Mist Inhalers (SMIs)	Dry Powder Inhalers (DPIs)	Nebulizers/nebules
Advantages	<ul style="list-style-type: none"> • Portable • Quick treatment • Generic options 	<ul style="list-style-type: none"> • Portable • Quick treatment 	<ul style="list-style-type: none"> • Portable • Quick treatment • Generic options 	<ul style="list-style-type: none"> • No coordination needed • Cost of short acting medication • Cost of jet nebulizer
Disadvantages	<ul style="list-style-type: none"> • Weekly cleaning with re-priming • Coordination required • Cost • Recommend spacer for best lung deposition, weekly cleaning of spacer 	<ul style="list-style-type: none"> • Wipe mouthpiece weekly with damp cloth • Set up and priming • Coordination • Cost 	<ul style="list-style-type: none"> • Occasionally wipe mouthpiece with dry cloth • Fast inspiratory effort • Cost 	<ul style="list-style-type: none"> • Long time for treatment • High cost of long acting medications • High cost of vibrating mesh nebulizers • Clean after each use, disinfect weekly (or more) • Jet nebulizer: change nebulizer set up (nebulizer and tubing) and filter 

Considerations when Selecting a Device

- Does the patient have any **cognitive barriers** to learning or retaining proper inhaler technique like dementia, stroke, infection, etc.?
 - If yes, consider nebulizer
- Does the patient have **functional decline** that would prevent proper inhaler technique like Parkinson's, arthritis, poor vision, stroke, muscle weakness, low inspiratory flow rate, etc.?
 - If yes, consider nebulizer
- Can the patient produce a **FAST and deep inhale**?
 - If yes, consider DPI
- Can the patient **inhale SLOW and deep WHILE** pressing the actuation button?
 - If yes, consider MDI/SMI
- Is the patient able to **hold breath** after inhalation?
 - If no, consider nebulizer or metered dose inhaler (MDI) with spacer
- Can the patient **afford** the medication?
 - If no, consider short acting bronchodilators (SABD)

Which is the best delivery device?

- Metered Dose Inhalers
- Soft Mist Inhalers
- Dry Powder Inhalers
- Nebulizer

COPD Action plans

Adapted from American Lung Association COPD Foundation

Green Zone: I am doing well today

- Inhaler working and symptoms best
- Usual amount of cough and phlegm/secretions
- Sleep well at night
- Appetite is good

Actions

- Use inhaler as prescribed
- Continue regular exercise plan
- Take all your medicines (even if you don't feel sick)
- Take daily medicines (even take on the back)

Yellow Zone: I am having a bad day

- More inhalers than usual
- Have less energy for my day activities
- Increased or changed phlegm/secretions
- Coughing and wheezing more often
- Swelling or ankles more than usual
- More coughing than usual
- Feet have been "bored stiff"
- Nose drip and eye symptoms worse than usual
- My appetite is not good
- My medicines not helping

Actions

- Continue daily medications, as listed on the back
- Call your provider to discuss change in symptoms and/or prescriptions
- While you wait for your provider to respond, use your rescue/inhaler **2-4 puffs every 4-6 hours** or as directed. **Do not use more than 12 puffs** in 24 hours. If you need more than 12 puffs, call your doctor.
- Use oxygen as prescribed
- Get plenty of rest
- Use special breathing instructions on the back, if given and symptoms worse (contact emergency)
- Call 911 or seek medical care immediately if you experience:
 - in speech
 - Chest pain with your shoulder/ribcage
 - Use what you know about **2-4 puffs every 4-6 hours** until symptoms improve. **Do not use more than 12 puffs** in 24 hours. If you need more than 12 puffs, call your doctor.

COPD360 Action Plan

My Name: _____ Date: _____
 My Street Name: _____ Phone: _____
 Emergency Contact: _____

Instructions: Read this COPD Action Plan to understand what to do if you have trouble breathing. These instructions will help you create a COPD action plan for you and your doctor. Use this COPD action plan when you need to take your medicines and breathe the medicine into your lungs. Do not use more than 12 puffs in 24 hours.

	MON	TUE	WED	THUR	FRI	SAT	SUN
I can do this							
I can do this							
I cannot do this							

My Green Days

My Yellow Days

My Red Days

Supportive Considerations

- Physical activity
 - Clear benefits and strong predictor of mortality, pursed lip breathing and diaphragmatic breathing improve pulmonary function and increase exercise tolerance
- Nutritional support
 - Dietary advice and nutritional supplementation can increase body weight, quality of life, respiratory muscle strength and 6-minute walk distance.
 - Rehabilitation, nutritional support and protein supplementation may improve fat free mass, BMI, and exercise performance
 - In malnourished hospitalized patients, protein enriched supplementation decreased mortality and improved handgrip strength and body weight 90 days post discharge.
- Panic, anxiety and depression
 - Treat as usual and encourage physical exercise, cognitive behavioral therapy and mind-body interventions (e.g. breathing exercises, mindfulness-based therapy, yoga, and relaxation)
- Fatigue
 - Self-management education, pulmonary rehabilitation, nutritional support and mind-body interventions
- Palliative care treatment of dyspnea
 - Opiates, neuromuscular electrical stimulation (NMES), fans blowing in face, chest wall vibration, pulmonary rehabilitation, acupuncture and acupressure

Manufacturer websites accessed 9/7/2022 GSK: GlaxoSmithKline, AZ: AstraZeneca, BI: Boehringer Ingelheim

Discharge Final Pause

- Does the patient have appropriate COPD treatment and do they understand when to use it?
 - Admitted for AECOPD
 - Controller maintenance therapy: LAMA/LABA +/- ICS
 - Rescue quick acting therapy: SABA +/- SAMA
 - Admitted for another reason with history of COPD: at least SABD
 - Do not duplicate LAMA/LABA/ICS
- Assess inhaler technique every visit, every time
 - "Show me how you use your inhaler"
 - Correct and reassess technique as needed
 - If unable to master technique, consider another device

LAMA=long acting muscarinic antagonist, LABA= long acting beta-2 agonist, ICS= inhaled corticosteroid, SABA= short acting beta agonist, SAMA= short acting muscarinic antagonist, SABD= short acting bronchodilator

Discharge Final Pause

- If discharging with nebulized medication, ensure working nebulizer at home.
 - May need new prescription for nebulizer
 - Review cleaning and changing nebulizer setup (disposable verses reusable) and filter.
- If discharging with new nebulized medications or new inhaler(s), ensure new prescription.
- If patient unable to afford inhaler or nebulizer medication, consider alternatives.
 - SABA/SAMA
 - Free inhaler coupon
 - Patient Assistance Programs

THANK YOU!
